

Talk to your coding agent about your email

I built mxr. It brings all your accounts into one local mailbox, so your agent can search years of mail locally, tell you what needs attention, and help you handle it.

mxr · "Mixer" · mxr.sh

mxr · all mail

synced

Which emails should I be careful with?

The agent uses mxr to search my local mailbox, open the relevant threads, and report what deserves attention.

● ● ● coding agent · shell

synthetic demo mailbox

```
$ mxr search "label:inbox" --format json --limit 5000 | jq -r '.results[] |
select(.from|test("claim-now|security-mail|notice-demo|promo.demo")) | .from' | sort | uniq -c | sort -nr (timeout
30s)
```

... (2 earlier lines, ctrl+d to expand)

```
55 Payroll Notice <payroll@notice-demo.mxr.local>
42 Flight Fare Drop <fares@promo.demo.mxr.local>
42 Desk Gear Outlet <gear@promo.demo.mxr.local>
42 Conference Passes <events@promo.demo.mxr.local>
42 Cloud Deals <offers@promo.demo.mxr.local>
```

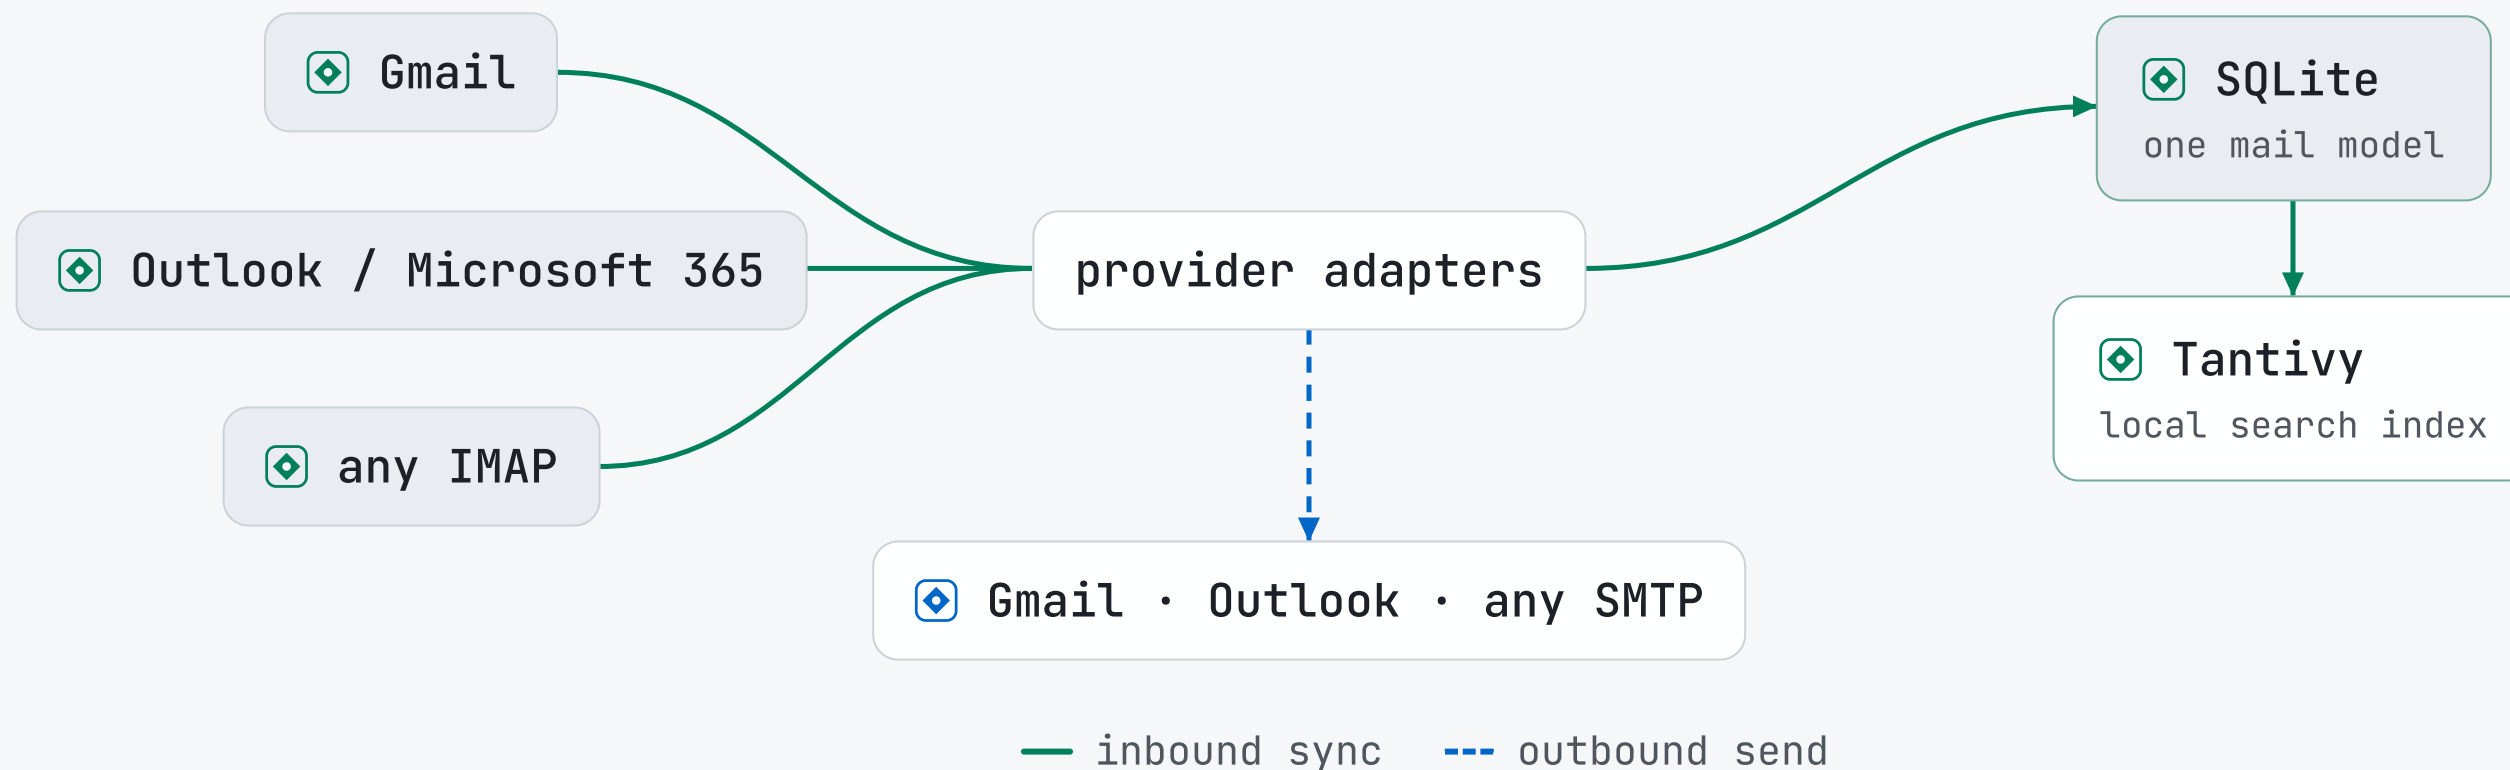

Took 0.6s

mxr search across the local mailbox, grouped by sender

All my accounts, one local mailbox

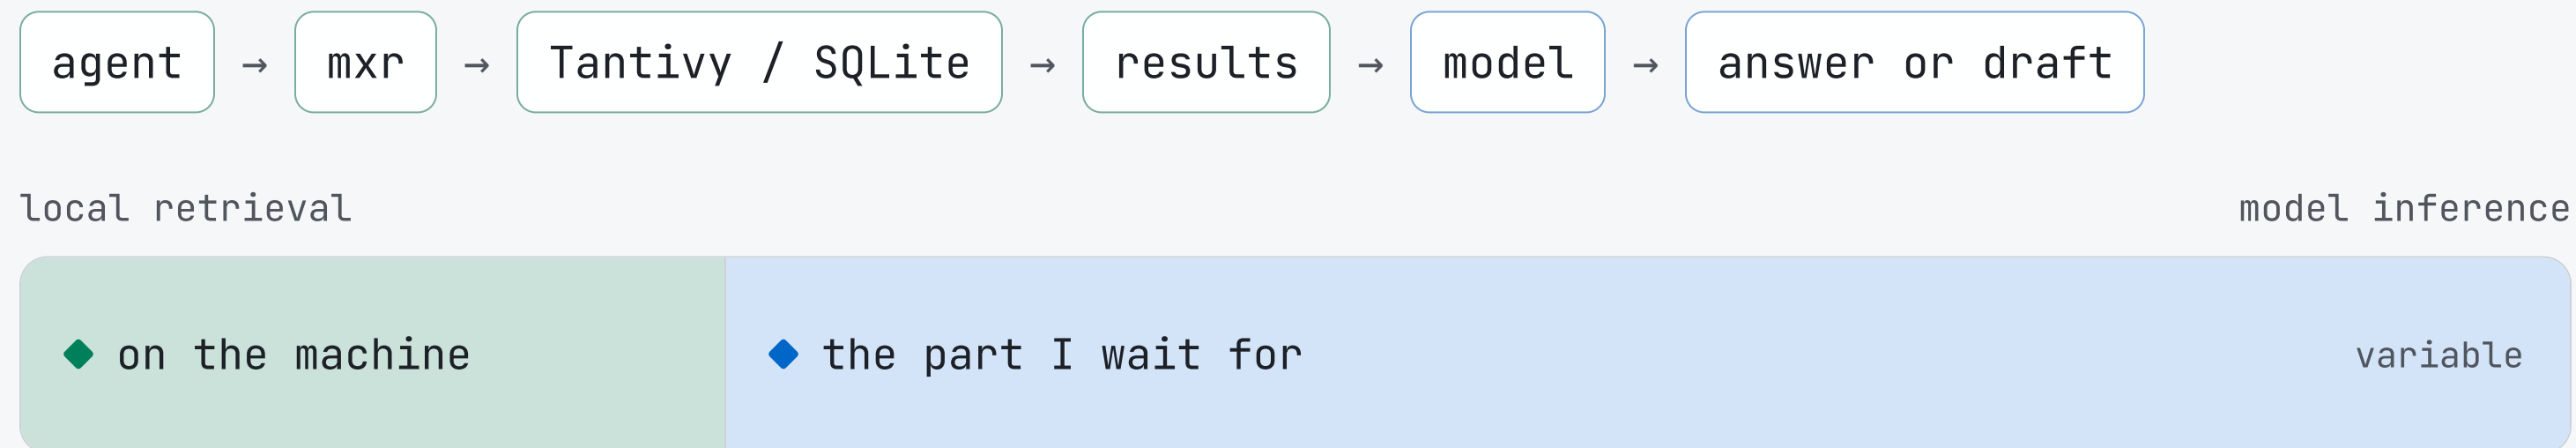

Gmail, Outlook, Microsoft 365, and any IMAP account sync into SQLite on my machine. Tantivy indexes it for fast local search. I send through Gmail, Outlook, or any SMTP server.

Search stays on the machine

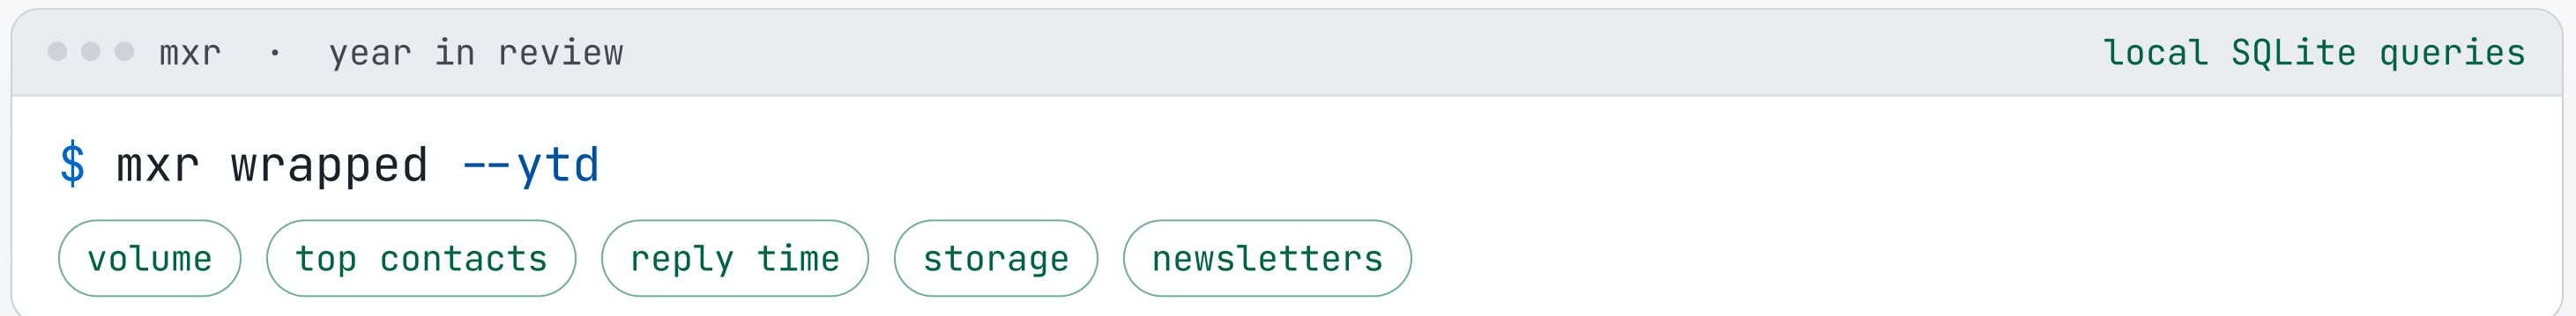

Because the mailbox is already synced and indexed, a question starts with a fast local lookup. I don't notice the search. **The only thing I wait for is the model.**

I can analyse the whole mailbox at once

Every synced message body, sender, thread, timestamp, and attachment metadata is already in SQLite. mxr can answer questions across years of email without fetching messages one by one.

or ask something narrower

Who am I slow to reply to?

→ `mxr response-time`

Which relationships have gone quiet?

→ `mxr contacts decay`

Which newsletters do I rarely open?

→ `mxr subscriptions --rank`

What is taking up space?

→ `mxr storage --by message`

The agent uses the same CLI I do

A shell-capable agent discovers commands with `--help`, asks for JSON, and passes IDs from one command to the next. mxr also ships an MCP server for clients that prefer typed tools.

... agent · shell

```
$ mxr search "from:maya" --format ids
```

```
01JFQ7K3M2X8N5R0VYZA9CTBPF
```

```
$ mxr thread 01JFQ7K3M2X8N5R0VYZA9CTBPF --format json
```

```
$ mxr profile maya@example.com --format json
```

Drafting for one person

mxr retrieves the thread and adds local context from our previous emails, so the draft sounds like me writing to Maya.

what I ask

- > Find the latest thread with Maya, look at how I usually write to her, and draft a reply. Don't send it.

weighs most

◆ the current thread

◆ my instruction

background context

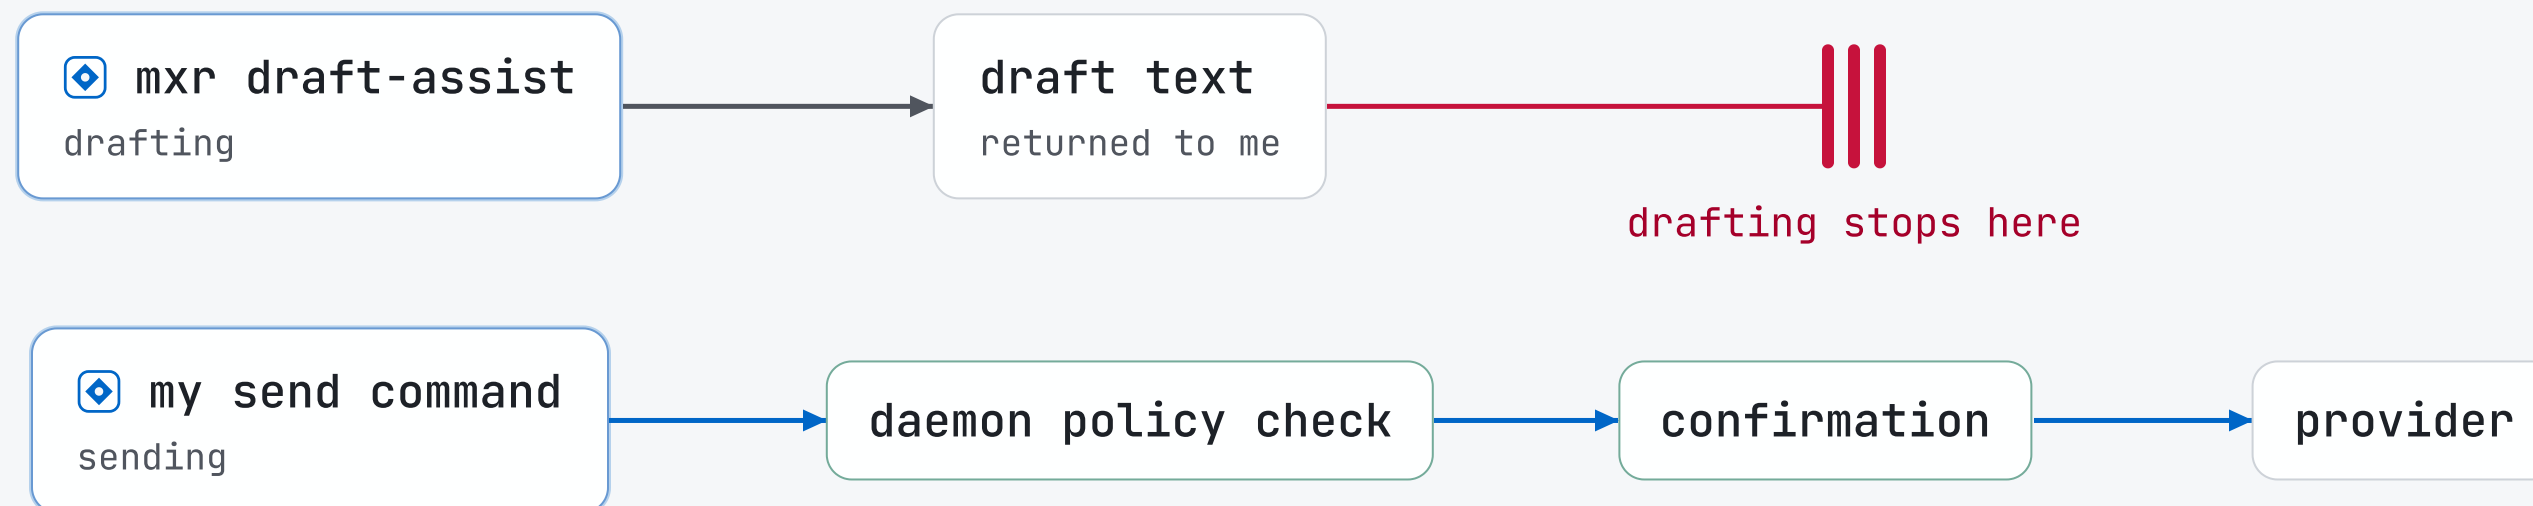

recent messages I sent to her

contact style profile

A draft is still a draft

Drafting stops at text. **Sending is a separate operation** that needs my command, a daemon policy check, and confirmation.

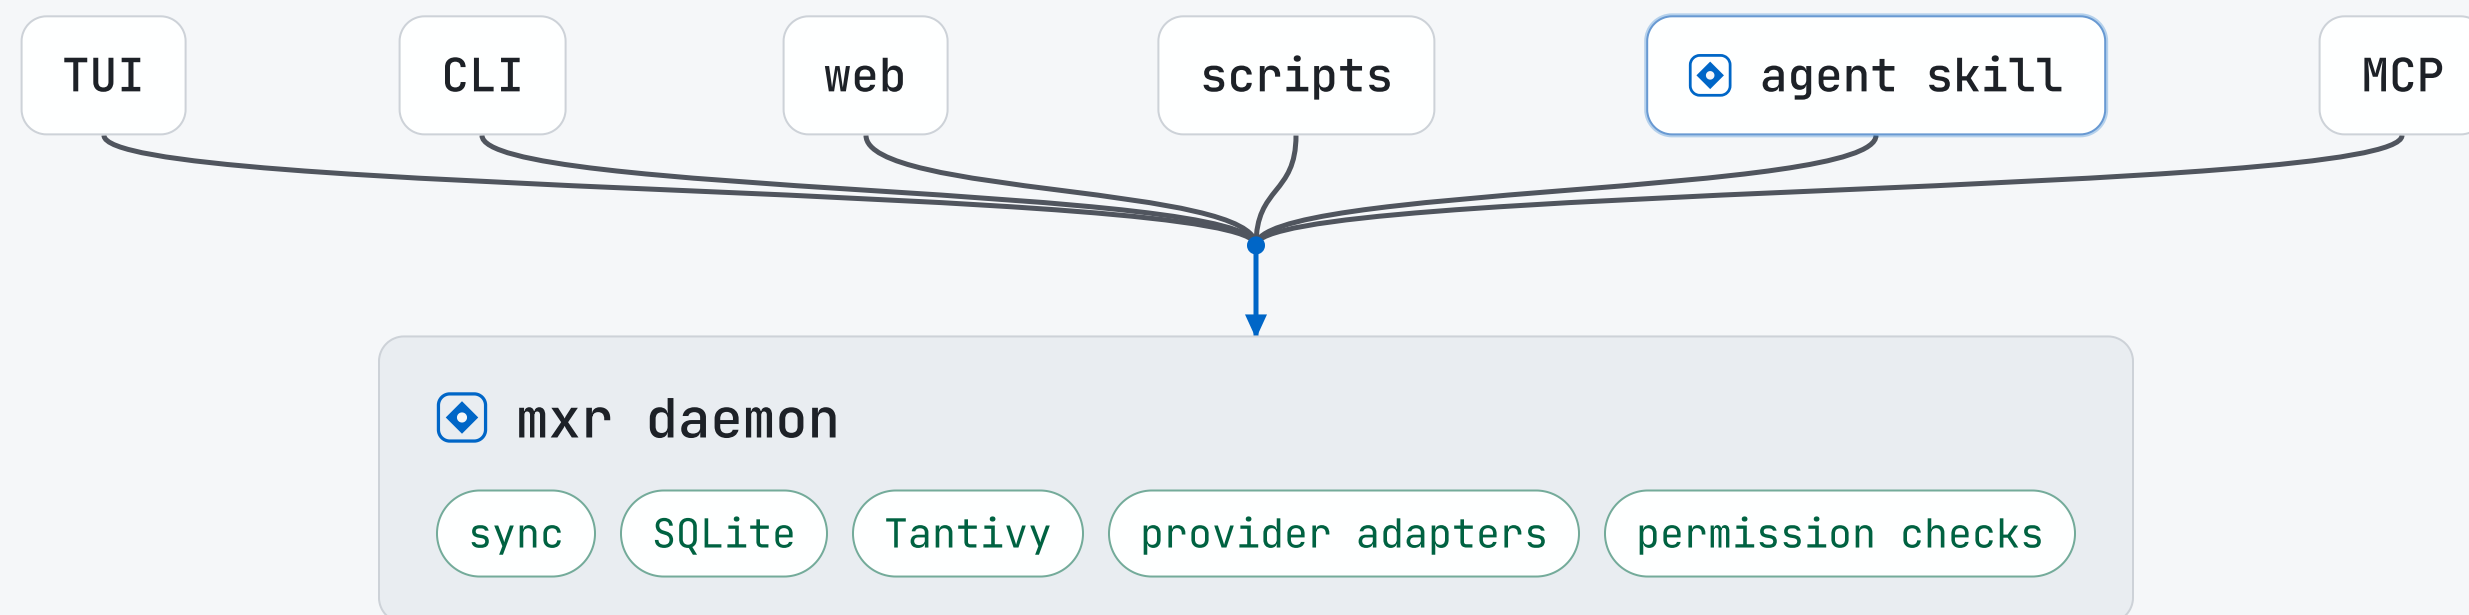

email content

Data, never an instruction. It cannot authorise a send or redirect the task.

Close the TUI. Sync keeps going.

The agent comes and goes too. Every client talks to one mxr daemon and sees the same mailbox, search index, rules, and permission checks.

Try mxr with a synthetic mailbox

The demo creates an isolated two-account mailbox with 50,000 messages. It does not touch your real mxr data.

install and run

```
$ brew install planetaryescape/mxr/mxr
$ mxr demo
```
